## 4-Bromothiobenzamide

Mahmood-ul-Hassan Khan,<sup>a</sup> Shahid Hameed,<sup>a\*</sup> Tashfeen Akhtar<sup>a</sup> and Jason D. Masuda<sup>b</sup><sup>a</sup>Department of Chemistry, Quaid-i-Azam University, Islamabad 45320, Pakistan, and <sup>b</sup>Department of Chemistry, Saint Mary's University, Halifax, Nova Scotia, Canada B3H 3C3Correspondence e-mail: [shameed@qau.edu.pk](mailto:shameed@qau.edu.pk)

Received 14 May 2009; accepted 14 May 2009

Key indicators: single-crystal X-ray study;  $T = 296$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å;  $R$  factor = 0.035;  $wR$  factor = 0.087; data-to-parameter ratio = 21.6.

The title compound,  $\text{C}_7\text{H}_6\text{BrNS}$ , crystallizes with two molecules in the asymmetric unit. The dihedral angles between the aromatic ring and the thioamide fragment are  $23.6$  (4) and  $20.5$  (3)° in the two molecules. In the crystal, there are intermolecular  $\text{N}-\text{H}\cdots\text{S}$  hydrogen-bonding interactions between the amine group and the S atoms.

## 4-Bromothiobenzamide

M.-H. Khan, S. Hameed, T. Akhtar and J. D. Masuda

### Comment

Thioamides are biologically active compounds, possessing a wide spectrum of activities (Klimesova *et al.*, 1999; Wei *et al.*, 2006). They have enormous practical and synthetic applicability and their importance and impact as synthetic intermediates is continuously growing (Jagodzynski *et al.*, 2003). Thioamides are generally synthesized using Lawesson's reagent (Cava *et al.*, 1985) or phosphorus penta sulfide (Kaboudin *et al.*, 2006). In this article, we wish to report the crystal structure of 4-bromobenzothioamide, which was synthesized by treating 4-bromobenzonitrile with 70% sodium hydrogen sulfide hydrate and magnesium chloride hexahydrate (Manaka & Sato, 2005) in continuation of our previous work on the synthesis and biological screenings of five membered heterocycles (Akhtar *et al.*, 2006, 2007, 2008).

The hydrogen bonding interactions between the nitrogen and sulfur atoms (3.500 (2) Å to 3.605 (3) Å) are in the range of those seen in *p*-trifluoromethylbenzothioamide where the corresponding interactions are between 3.3735 Å and 3.5133 Å (Jian *et al.*, 2006) and in the analogous chloride compound where the N...S distances are 3.3769 (15) Å and 3.4527 (15) Å (Khan *et al.*, 2009).

### Experimental

The slurry of 70% sodium hydrogen sulfide hydrate (21.98 mmol) and magnesium chloride hexahydrate (10.99 mmol) was prepared in DMF (40 mL). 4-Bromobenzonitrile (11.0 mmol) was added to the slurry and the mixture stirred at room temperature for 2 h. The resulting mixture was poured into water (100 mL) and the precipitated solid collected by filtration. The product obtained was resuspended in 1 N HCl (50 ml), stirred for another 30 min, filtered and washed with excess water. The recrystallization of the product from chloroform afforded the crystals of 4-bromobenzothioamide suitable for X-ray analysis.

### Refinement

The hydrogen atoms were placed in geometrically idealized positions of 0.93 Å (aromatic C—H) and 0.86 Å (amide N—H) and constrained to ride on the parent atom with  $U_{\text{iso}}(\text{H}) = 1.2 \text{ UEq}(c)$  for aromatic and amide protons.

### Figures

Fig. 1. Molecular structure of 4-bromobenzothioamide showing displacement ellipsoids at the 50% probability level (for non-H atoms).

Fig. 2. Packing diagram of 4-bromobenzothioamide. Displacement ellipsoids are shown at the 50% probability level (for non-H atoms).

### Data collection

Bruker APEXII CCD  
diffractometer

Radiation source: fine-focus sealed tube

Monochromator: graphite

$T = 296$  K

$\phi$  and  $\omega$  scans

Absorption correction: multi-scan  
(SADABS; Bruker, 2008)

$T_{\min} = 0.384$ ,  $T_{\max} = 0.620$

12968 measured reflections

3911 independent reflections

2706 reflections with  $I > 2\sigma(I)$

$R_{\text{int}} = 0.025$

$\theta_{\max} = 28.3$ °

$\theta_{\min} = 2.1$ °

$h = -25 \rightarrow 25$

$k = -13 \rightarrow 14$

$l = -10 \rightarrow 10$

### Refinement

Refinement on  $F^2$

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.035$

$wR(F^2) = 0.087$

$S = 1.03$

3911 reflections

181 parameters

Primary atom site location: structure-invariant direct  
methods

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring  
sites

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.0372P)^2 + 0.7786P]$

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.001$

$\Delta\rho_{\max} = 0.82$  e Å<sup>-3</sup>

$\Delta\rho_{\min} = -0.77$  e Å<sup>-3</sup>

Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
